

Student response _____

Price Market for milk powder

-
- This image shows a blank sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

eLearneconomics: Price controls (1a)

Solutions

Minimum (floor) price.

The government has to decide what to do with the resulting surplus, usually stockpile it and sell it at a later date.

The government may impose a minimum price to protect producers from receiving unreasonably low prices for their output.

eLearneconomics: Price controls (2)

Student response

- On the monthly market for infant formula for new born babies graph above, show the effect of a maximum price control that reduces the price by 50%. You must label the maximum price (P_{\max}), the quantity demanded (QD) and quantity supplied (QS).
- Referring to the graph, fully explain the consequences of a maximum price control on this market. Include the following in your explanation:
 - quantity demanded before and after the maximum price control
 - quantity supplied before and after the maximum price control
 - a problem the maximum price control might create
 - a possible solution for the above problem.

This image shows a single sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

eLearneconomics: Price controls (2a)

Solutions

Quantity demanded increases from 5 000 tins to 8 000 tins (Q to Q_d).

Quantity supplied decreases from 5 000 tins to 2 000 tins (Q to Q_s).

There will be a shortage of 6 000 tins of milk formula for babies, which is a problem. Some consumers will be willing to pay more than the \$15.00 per tin which is illegal and creates a black market.

Solutions to the shortage problem could include rationing, first-in-first-served or providing producers with a subsidy in order to increase supply.

Student response

-
- The graph shows the market for milk. The vertical axis represents Price (\$ per litre) and the horizontal axis represents Quantity (million litres). The demand curve 'd' is downward-sloping, and the supply curve 's' is upward-sloping. They intersect at an equilibrium price of \$3.40 per litre and an equilibrium quantity of 8 million litres.
- | Quantity (million litres) | Price (\$ per litre) - Demand (d) | Price (\$ per litre) - Supply (s) |
|---------------------------|-----------------------------------|-----------------------------------|
| 0 | 3.80 | 3.05 |
| 2 | 3.65 | 3.15 |
| 4 | 3.50 | 3.25 |
| 6 | 3.35 | 3.35 |
| 8 | 3.20 | 3.40 |
| 10 | 3.05 | 3.45 |
| 12 | 2.90 | 3.55 |
| 14 | 2.75 | 3.65 |
| 16 | 2.60 | 3.75 |

- b Referring to the graph, identify:
- the price that consumers pay before and after: before: _____ after: _____
 - the price that producers receive before and after: before: _____ after: _____
 - the value of sales before and after: before: _____ after: _____
- c Fully explain the effects of introducing a maximum price on milk consumers. In your answer you should:
- explain the change in price, the change in the quantity demanded and in consumer spending on milk
 - explain two flow-on effects on society in general
 - refer to the data above.

eLearneconomics: Price controls (3a)

Solutions

b Referring to the graph, identify:

- the price that consumers pay before and after: before: \$3.40 per litre (P_e) after: \$3.20 per litre (P_{max})
- the price that producers receive before and after: before: \$3.40 per litre (P_e) after: \$3.20 per litre (P_{max})
- the value of sales before and after: before: \$3.40 x 8 million equals \$27.2m after: \$3.20 x 4 million equals \$12.8m

A maximum price (P_{max}) is a price control set by government, prohibiting the charging of a price higher than a certain level, in this case \$3.20 per litre on milk. As the price of milk falls the quantity demanded increases from 8 million litres (Q_e) to 10 million litres (Q_e').

The change in consumer spending on milk falls from \$27.2m to \$12.8m.

Several flow-on effects include that consumers desire 10 million litres but can only purchase (legally) 4 million litres, that is, there is a shortage of 6 million litres of milk monthly, which is a problem. A black market may arise because some consumers who can afford to pay higher prices might offer to pay more than the legally set price. Some consumers may miss out, others may switch to a substitute good (e.g., milk powder).

Explains maximum price in depth. Values (figures) stated. Uses appropriate economic terms. Explains flow-on effects.

eLearneconomics: Price controls (4)

Student response

- a On the graph of the Monthly market for organic eggs below, show the effect of a minimum price of \$7 per dozen (labelled as P_{\min}).

- b Fully explain the effects of introducing a minimum price for organic eggs on egg producers. In your answer you should:
- explain the change in price, the change in quantity demanded and quantity supplied
 - explain the effect on organic egg producers. Refer to the data.

This image shows a single sheet of white paper with horizontal blue or grey ruling lines. The lines are evenly spaced and run across the width of the page. There are approximately 20 lines visible. The paper has a slight shadow on the right side, suggesting it's resting on a surface.

eLearneconomics: Price controls (4a)

Solutions

A minimum price control is a price control set by government when the market price is not allowed to fall below a minimum (floor) level, in this case \$7 per dozen for organic eggs.

The quantity demanded by consumers falls from Q_e (12 000 dozen) to Q_d (6 000 dozen). The quantity supplied of organic eggs increases from Q_e (12 000 dozen) to Q_s (18 000 dozen).

Organic egg producers' revenue increases from \$60 000 to \$126 000. Organic egg producers will switch resources into organic egg production because it is relatively more profitable. Egg producers now receive P_{min} (\$7 per dozen) instead of P_e (\$5 per dozen).

Explains minimum price in depth. Shows the change on the graph and uses appropriate economic terms.
